

DND

A multi agent system { or System Creator }

An application that works on top of existing harnesses. Should be Harness or LLM provider agnostic, as much as it can be.

We have agents that we need for a Software Engineering Company.

We will have an Agent_Templates folder that will hold templates for all agents

We'll create Agent's description md files for each of the following agents.

1) CEO → Warlock

(main entry point of application)

Anything New comes to CEO first

He will delegate the work downstream

2) HR → Mind Flayer / Illithid

- * after receiving new work, CEO will ask HR for a manager.
- HR agent will be responsible for any new agents.
- * So, initially we'll only have CEO & HR.
[Important Requirement] → ONLY HR can spawn new agents.
- * HR will take the required template from templates folder, and will spawn a new agent.
- * For a new project, she'll get a manager agent.
- * Later, HR will spawn any agent that Manager agent asks about.

3) Manager → Bard

- Only new project requests will go through CEO
- * Anything related to an existing project that already has a manager will

go through managers.

Based on requests Manager will request more agents and delegate work to them. (Manager will be router agent)

4) Solution Architect → Wizard
etc etc

➤ There will be a shared state for each project.

→ It'll clearly say what each agent is working on.

→ It'll be a multi agent system,
HR system will have, name, role,
project and id of every agent

→ HR system is just a json file that
HR agent will maintain.

→ Using the details in the HR systems
agents will be able to talk to each
other.

Pass each other useful information,

Ask for help with missing information or context.

➤ System will spawn Marshall agents every 5 minutes, they'll inform HR of any obsolete agents and their data in HR system.

→ HR can then remove them from HR system after making sure that they are actually done

* They'll check all agents if they are going to run out of context, if yes they'll let manager and HR know to spawn new process and do handovers to them cleanly without losing useful context.

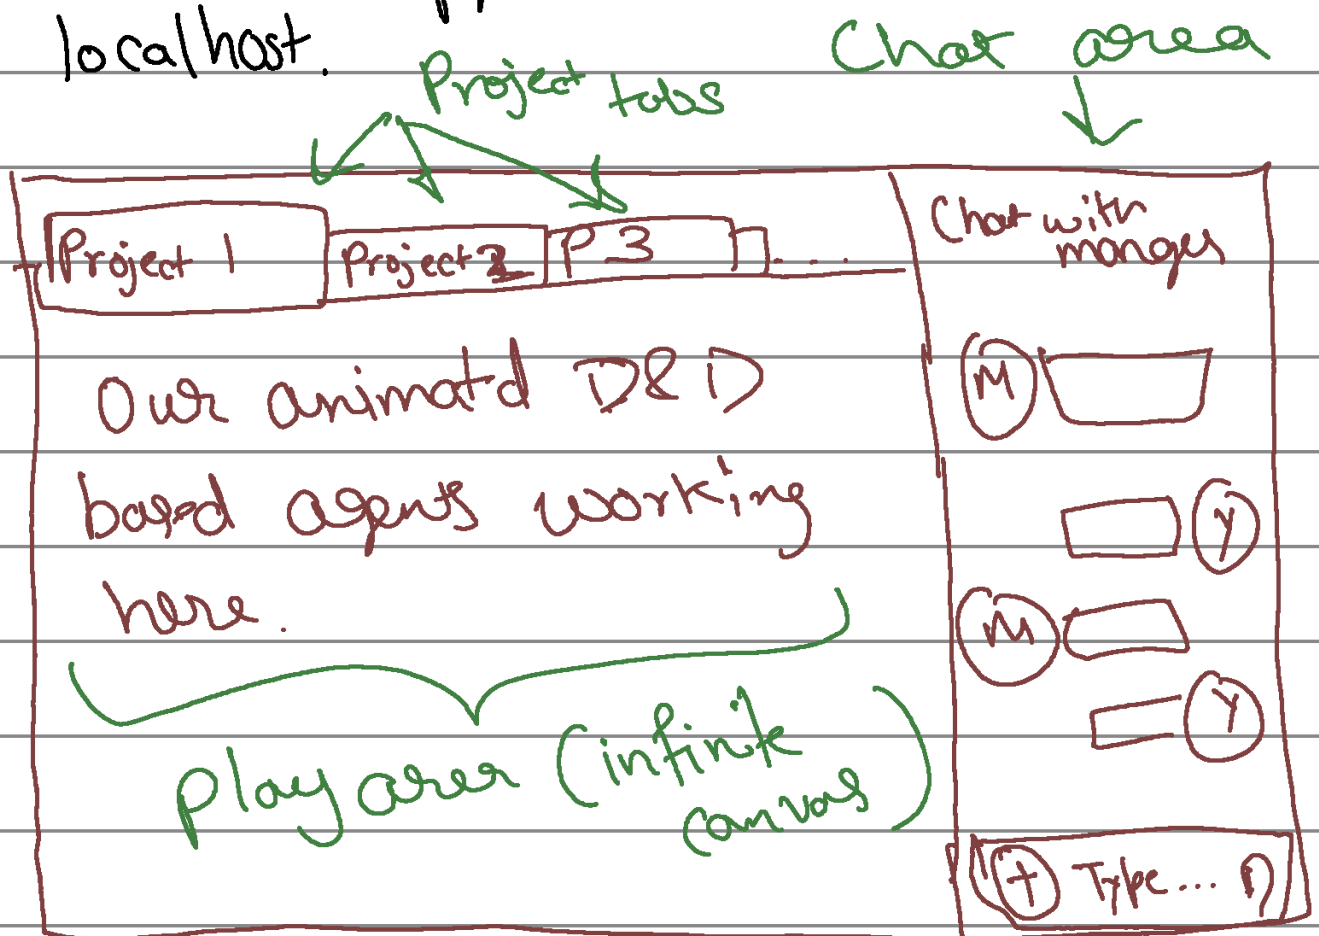

* They'll check if any agent is stuck will be running shell tasks or hasn't made any progress in last 10 minutes, if so, they'll let manager know and manager can let the team know if

more context is needed to decide
What to do with them (Human
in Loop)

So for this was all backend for how
agents will work.

Now frontend

A web application accessible from
localhost.

Clicking on any agent's avatar in play area, will open that agent's chat.

Chat area will have tabs too.

tab 1 → Chat

tab 2 → Agent details and stats like they appear in D&D or Baldur's gate

tab 3 → what though, process they are going through

tab 4 → their personal context visualized

tab 5 → their relationships → who they have interacted with and how much.
